

ABSTRACT

A Z-height control tab maintains the distance between an airbag cover and a reaction housing. The reaction housing and airbag cover interlock to define a Z-height. The Z-height is defined as the distance between the two interlocked members. The Z-height control tab extends from the reaction housing and engages a wall edge of a skirt extending from the airbag cover. This Z-height control tab engagement maintains the Z-height by preventing the airbag cover and the reaction housing from compressing together.
